

It's About Physics

The science of hydrocarbon production is sophisticated, and oil and gas professionals have been at the forefront of progress since the industry's inception. **GlobalEnhanced** leverages the concept of Brownian motion to impact the subsurface environment, better penetrate formations, and lift and release fluids and gasses in the well. All of this happens at a microscopic level, and the result is capturing a greater percentage of product than can be obtained using traditional processes. Extensive third-party testing at Canadian universities has verified these products and their performances in several applications, and operator results continue to generate excitement for the future of production optimization.

Do More with Less

The oil and gas industry has a remarkable track record of finding process efficiencies, and has always incorporated cutting edge science into operations. In an era of increasing costs, burdensome regulatory environments, and lower capex budgets, operators are tasked with developing process improvements that maximize value. **GlobalEnhanced** is a proven technology that optimizes oil recovery in re-stimulation, flooding, and fracturing procedures. **GlobalEnhanced's** formulas have ***increased customer production volumes significantly, and delivered exceptional, lasting ROI.***

How it Works

GlobalEnhanced fluid solutions can be incorporated into vertical, directional, and horizontal wells as the sole additive, and are simpler, less toxic and safer than conventional products. We have delivered exceptional performance outcomes in staged treatments, or dedicated volumes in both oil and gas producing wells, as well as injection wells, and the low toxicity and ease of implementation make the **GlobalEnhanced** fluid line a quick and economical choice. Which product is chosen depends on the type of fluid that will be produced, as well as formation qualities, and well history.

Applications

- Production Separation
- Heavy Oil Flow
- EOR
- Stimulation/Re-stimulation
- Flooding
- Fracturing
- Production Maximization
 - Remove & Prevent Build Up
 - Reduce Downtime
